

Could your teen be depressed?

DEPRESSION IN TEENS INVOLVES:

- Feelings of continuous sadness
- Irritability
- Loss of interest and enjoyment in activities
- Changes in weight or sleep
- Thoughts of worthlessness, guilt, or suicide

Take the First Step:

If you have a teen between the ages of 11 and 16 who may be depressed, please contact Candice Croft at the PASS Study:

PASS Intervention Study for Teens with Depression

This study examines the possible effects of a new experimental intervention for depressive symptoms, and how youths' brains and behavior may be influenced. This research study does *not* involve any medications.

Participation involves a diagnostic assessment, six weekly sessions of an experimental intervention (PASS) or a comparison intervention (Cognitive Therapy), as well as visiting our office with your child up to six times. You and your child will complete questionnaires and clinical interviews. Children will also have an fMRI scan where their brain activity is measured while they complete computerized tasks.

Youth will be compensated with a debit card for completion of the research study.

**For more information and to see if you qualify call Candice at:
